

Informe TP N°1

- **Objetivo del TP:** Obtener los conocimientos necesarios para poder configurar un servidor DNS en una red.
- **Materiales:** Packet Tracer
- **Escenario:** Configurar una red que conste de una desktop, dos notebooks, un switch y un servidor DNS.

- ✓ Desktop01 – 192.168.1.2 – 255.255.255.0
- ✓ Notebook01 – 192.168.1.3 – 255.255.255.0
- ✓ Notebook03 – 192.168.1.4 – 255.255.255.0
- ✓ ServerDNS – 192.168.1.10 – 255.255.255.0

Actividad:

- Configurar el escenario mencionado en el punto anterior.
- Realizar un ping mediante IP desde las terminales al servidor.
- Realizar un ping mediante hostname desde las terminales al servidor.
- Agregar los siguientes registros host A: Desktop01 – 192.168.1.2, Notebook01 – 192.168.1.3, Notebook02 – 192.168.1.4 y ServerDNS – 192.168.1.10.
- Repetir el punto 3.
- Agregar un registro CNAME que haga referencia a **desktop01** con el nombre **escritorio**. Luego realizar un ping desde **notebook02** a **escritorio**.
- Desarrollar una conclusión del trabajo realizado.

1) Abrimos el programa packet tracer y configuramos el escenario que se nos pide

11

Hacemos doble click en cada dispositivo

12

Presionamos en
“desktop”, y luego en
“IP configuration”

Nos aparecerá la siguiente ventana, en donde nos permite la configuración de cada dispositivo.

The screenshot shows a network configuration window titled "IP Configuration" with a close button (X). The "Interface" dropdown is set to "FastEthernet0".

IP Configuration

☐ DHCP ☒ Static

IPv4 Address:

Subnet Mask:

Default Gateway:

DNS Server:

IPv6 Configuration

☐ Automatic ☒ Static

IPv6 Address: /

Link Local Address:

Default Gateway:

DNS Server:

802.1X

☐ Use 802.1X Security

Authentication:

Username:

Password:

Por último, completamos con los datos otorgados en el primer punto para cada uno de los dispositivos agregados:

Desktop01 – 192.168.1.2 (IPv4 Address)
 Notebook01 – 192.168.1.3 (IPv4 Address)
 Notebook03 – 192.168.1.4 (IPv4 Address)
 ServerDNS – 192.168.1.10 (IPv4 Address)
 Subnet Mask – 255.255.255.0
 Default Gateway- 192.168.1.1

2) Realizamos un ping mediante IP desde las terminales hacia el servidor

2

Vamos a "desktop", hacemos click en "command prompt"

Escribiendo ping 192.168.1.10 (IP del servidor DNS) probamos con cada dispositivo si llegamos haciendo ping por IP hacia el servidor DNS.

Ping con Desktop01

Ping con Notebook01

Ping con Notebook03

```

Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.1.10

Pinging 192.168.1.10 with 32 bytes of data:

Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>|
  
```

Vemos que haciendo ping mediante IP llegamos correctamente desde todos los dispositivos conectados

3) Realizamos un ping mediante hostname desde los diferentes terminales hacia el server DNS

Vamos a “desktop”, hacemos click en “command prompt”

2

Ahora escribimos “ping server-dns”. Probamos con cada dispositivo, haciendo ping por hostname hacia el servidor DNS.

Ping con Desktop1

Desktop1 192.168.1.2

Physical Config **Desktop** Programming Attributes

Command Prompt

```

Cisco Packet Tracer PC Command Line 1.0
C:\> ping 192.168.1.10

Pinging 192.168.1.10 with 32 bytes of data:

Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\> ping server-dns
Ping request could not find host server-dns. Please check the name and try again.
C:\>
  
```

Ping con Notebook1

Notebook1 192.168.1.3

Physical Config **Desktop** Programming Attributes

Command Prompt

```

Cisco Packet Tracer PC Command Line 1.0
C:\> ping 192.168.1.10

Pinging 192.168.1.10 with 32 bytes of data:

Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128
Reply from 192.168.1.10: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.1.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\> ping server-dns
Ping request could not find host server-dns. Please check the name and try again.
C:\>
  
```

Ping con Notebook3

Vemos que haciendo ping mediante hostname no llegamos correctamente desde los dispositivos conectados, debido a que no se puede encontrar el host server-dns

4) Agregamos los siguientes registros host A en el servidor DNS:

Desktop01 – 192.168.1.2

Notebook01 – 192.168.1.3

Notebook03 – 192.168.1.4

ServerDNS – 192.168.1.10.

Deberían quedar agregados los registros DNS tipo A de la siguiente manera:

Server-DNS 192.168.1.10

Physical
Config
Services
Desktop
Programming
Attributes

    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>|
  
```

Vemos que haciendo ping mediante el hostname server dns, luego de declarar el registro tipo A en el servidor DNS, podemos llegar hacia el respectivo servidor.

6) Agregamos un registro CNAME que haga referencia a Desktop 1 con el nombre escritorio.

3

Vamos a "DNS"

2

Vamos a "Services"

5

En "Name"
agregamos el
nombre del
registro CNAME
"escritorio"

6

En "Host Name"
agregamos el nombre
del host, el cual es
"desktop01"

4

Seleccionamos el
tipo de registro
como "Type
CNAME"

Debería quedar algo así, el registro CNAME agregado como escritorio haciendo referencia al host name desktop01

Luego realizamos un ping desde notebook03 a escritorio.

2

Vamos a “desktop”, hacemos click en “command prompt”

Escribimos ping “escritorio” (registro CNAME) y probamos si llegamos hacia el host desktop01 (Registro Tipo A). Vemos que haciendo ping llegamos correctamente hacia este terminal.

```

    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
  
```

7) Conclusión

En este trabajo pudimos conectar una red de forma sencilla, con no muchos elementos, un servidor DNS, un desktop y dos notebooks, todos conectados entre sí con un switch 2960-24TT.

Configuramos las IPs de cada terminal, y les agregamos la máscara de red y el servidor DNS a cada uno de los terminales.

Luego de hacer esto, hicimos pruebas de ping desde los diferentes terminales hacia el servidor DNS. Primero, intentamos realizar el ping mediante la dirección IP del servidor, lo cual tuvo éxito ya que este servidor tenía asignada su respectiva dirección IP.

Segundo, intentamos hacer ping hacia el servidor DNS mediante hostname, lo cual no tuvo éxito debido a que no se encontró declarada la dirección IP del servidor DNS como registro tipo A en el propio servidor DNS.

Tercero, registramos todas las IPs de los terminales y la del servidor DNS, como registros tipo A, en el propio servidor DNS, para poder hacer ping desde los diferentes terminales hacia el servidor mediante Host Name.

Cuarto, hicimos ping desde los terminales hacia el servidor DNS mediante Hostname, para comprobar que la configuración de los terminales y el servidor en el DNS estaban hechas de manera correcta.

Por último, agregamos en el servidor DNS un registro CNAME el cual hacía referencia al registro tipo A desktop01 con el nombre de escritorio, para que cuando hagamos ping, podamos hacerlo mediante este registro CNAME. Luego, se comprobó mediante ping hacia escritorio que el registro CNAME se configuró correctamente como el registro tipo A desktop01.
